# Secure Visits Management

---

# THE 'HUB' OF THE VISITS PROCESS FOR SOCIAL, LEGAL, OFFICIAL VISITORS AND CONTRACTORS

Award winning Biometric Visits Management Solution, pioneered in 2004, is used in 75% of UK prisons and other secure establishments to prevent escapes and streamline the visitor management process.

Fully configurable turnkey system uses biometrics to identify and track residents and all types of visitors whilst on site. Suitable for prisons, secure training centres, immigration removal centres and secure hospitals, the system improving overall security and reducing the possibility of escapes through the visits hall.

Social visits become more informal and relaxed because detainees may wear regular clothes in the Visits hall rather than bibs for identification, making visits more family friendly.

*"The system is one of the best aids to security I have ever seen in the Prison Service: easy, efficient and a work-improving tool. It actually makes things easier for the user."*

Visits Officer

## Administrative Efficiency

Booking and managing visits can be a complex, time-consuming process and the risk of incidents between staff, visitors, and prisoners is ever present.

As well as managing booking of visits by phone, online, and through resident's self-service, the system is configurable to suit particular visits rules and resident's risk profiles. Separating visit times of high-risk residents reduces the risk of volatile situations, improving the safety and security during visits times.

Unilink's Secure Visits management system enables efficient, reliable and secure management of the entire visits process for social, legal and official visitors. It automates and synchronises movement of people across the site, replacing paper print outs and other less reliable identification methods.

The system is modular, flexible and can be seamlessly integrated with existing Offender Management and other 3rd party applications. Registering staff also enables integrations with staff key/radio vending and access control systems, to provide full auditability and improve site security overall.

## Biometrics and Visits Security

The ability to efficiently manage the visits process, accurately identify visitors, manage visitors' profiles: set alerts, ban visitors detect potential drug smuggling and prevents escapes, are essential tasks for all secure establishments.

Fingerprint and/or facial recognition biometrics are used to register residents and visitors, to verify visitors' identity against scanned, stored and checked ID documents, enabling reliable identification of everyone entering and exiting the establishment.

Identifying visitors at regular checkpoints, allows their movements to be tracked and prevents potential escapes through the visits route. This creates a more secure environment for staff, visitors and residents. Biometric checks are quick, reducing queueing time for visitors and deterring illegal activity.

## Intelligence and Analytics

Intelligence reports derived from visits identify unusual visiting patterns such as people visiting multiple prisoners. The system has a fully searchable database with an integrated report writing tool enabling intelligence gathering on prisoners, detainees and visitors.
